## Nephelometric Turbidity Unit (NTU) Scale Factor

Turbidity units expressed in NTU can be derived using the equation:

$$\text{NTU} = \text{Scale Factor} \times (\text{Output} - \text{Dark Counts})$$

			<b>Digital</b>
<b>Dark Counts</b>		50	counts
<b>NTU Solution Value</b>		1870	counts
<b>Scale Factor (SF)</b>		0.0243	NTU/count
<b>Maximum Output</b>		4130	counts
<b>Resolution</b>		1.0	counts
Ambient temperature during calibration	22.8	°C	

**Dark Counts:** Signal output of the meter in clean water with black tape over detector.

**SF:** Scale factor is determined using the following equation:  $\text{SF} = \text{xx} \div (\text{Output} - \text{Dark Counts})$ , where xx is the value of a Formazin concentration. For example:  $12.2 \div (2011 - 50) = 0.0062$ .

**Maximum Output:** Maximum signal output the meter is capable of.

**Resolution:** standard deviation of 1 minute of collected data.
